

# Kisanet Shshay

## Software Engineer

### CONTACT

-  [shshaykisanet@gmail.com](mailto:shshaykisanet@gmail.com)
-  [Kisanet Shshay](#)
-  [Kisanet Shshay](#)
-  Portfolio

### EDUCATION

**AkiraChix**  
**codeHive** - Diploma in  
Information Technology  
February 2025 – present

### RELEVANT COURSES

- Mobile development
- Backend development
- Frontend web
- Data and software architecture
- UI/UX design
- Product Management
- Quality assurance
- UX Research

### SKILLS & EXPERIENCE

- Programming Languages: Python, SQL, Kotlin, JavaScript, TypeScript
- Libraries & Frameworks: Pandas, NumPy, scikit-learn, Matplotlib, Seaborn, Django REST Framework, Next.js React.js Tailwind CSS, Android Jetpack
- Tools & Platforms: PostgreSQL, Jupyter Notebook, Google Colab, GitHub, Postman, Supabase, Celery, Redis, Jetpack Compose
- Database management system tools: DBeaver

### ABOUT ME

Cybersecurity stands at the frontline of our digital lives, where every click and connection carries both opportunity and risk. What's most compelling for Kisanet is the ongoing challenge of staying ahead of threats, and the critical role that awareness and technology play in building trust. She sees cybersecurity not just as protection, but as a way to empower people and organizations to navigate the digital world with confidence. For her, it's an exciting space where innovation and responsibility go hand in hand to shape a safer, more resilient future.

### PROJECTS

#### FeedLink

Currently developing FeedLink, a digital platform aimed at reducing food waste from reaching landfills and promoting a circular economy that benefits both communities and the environment.

#### Approach and Key Learnings:

- Conducted desk and primary research to analyze the problem and drive actionable insights for digital solutions.
- Designed user flows, wireframes, and interactive UI mockups using Figma, Photoshop, and Adobe Illustrator.
- Developed a responsive informational website using Next.js, Tailwind CSS, and TypeScript to showcase the product and team details.
- Designed the system architecture and developed SQL database to ensure efficient data management and scalability.
- Built a mobile app using Kotlin, to browse surplus listings by location/category, claim items instantly, and pay securely via M-Pesa (Daraja API).
- Built an interactive dashboard with Next.js, Tailwind CSS, and TypeScript to upload surplus, track claims and payments, and view real-time impact metrics like food diverted and CO<sub>2</sub> saved.
- Developed RESTful APIs using Django and integrated an external API:- Daraja API.
- Executed unit, integration, and system tests to ensure reliability and functionality across all features.
- Used Jira to plan, assign and keep track of team tasks.

#### Titanic Survival Prediction Classification Modelling

Built a binary classification workflow to predict passenger survival based on attributes such as passenger class, gender, age, and fare providing insights into key factors that influenced survival during the Titanic disaster.

#### Approach and Key Learnings:

- Visualized patterns with Matplotlib and Seaborn, identifying gender, class, and age as key predictors to ensure a balanced assessment.
- Extracted titles, created family size and age groups, and encoded categorical variables using Scikit-learn preprocessing to transform raw data into meaningful features that highlight important social and demographic patterns, such as the number of spouses and children influencing survival chances.
- Trained and compared three classification models Logistic Regression, Decision Tree, and Random Forest using stratified train-test splits to maintain class balance and evaluated performance with accuracy, F1-score, and ROC-AUC.
- Assessed model evaluation and tuning with Accuracy, F1-score, ROC-AUC, and optimized using GridSearchCV with cross-validation to ensure balanced performance and reduce overfitting, enabling reliable generalization to new data.
